

Scenarios for CHICA SWO Construction/Renovation Presentation

1. Your long term care facility is adding a new wing adjacent to the locked ward. What level of preventative measures will be required during the construction and what role will the IP play. Who needs to be involved in the planning?

2. You are renovating an endo room in your endoscopy area. What preventative measures will be required during the construction and what additional responsibilities will the IP acquire? It is expected that 2 rooms will continue to be used for endoscopy during this retrofit.

3. The Medical Device reprocessing area is getting a complete retrofit. It means the department will be out of commission over a four day weekend. It is adjacent to the OR. What preventative measures will be required. What will need to be in place before the medical device reprocessing area can open and the OR suites adjacent can be used. How will you ensure that an emergency OR suite will be available over the weekend.

4. On the maternity floor, IT has requested they be able to pull cables through the ceiling tiles- there are three cables they will need to thread through the area above the tiles. The ceiling will only be opened for a short period and the work should be done in a day shift. What level and preventative measures will be required? Who will need to be involved in the planning?
